

EVOLUTION

You can't put in sequence the origin of reciprocating parts that are necessary for the viability of the whole organism and of the parts themselves. Additionally, the biosphere involves two sexes that both must be present from the beginning in a combinable fashion because entropy means the organisms will die; so they have to be replaced by reproduction. Living organisms involve systems of systems that must all be present from the beginning or the organism is not viable, so there cannot be step-by-step change from one set of systems to another set of systems, all the while with ongoing viability.
